

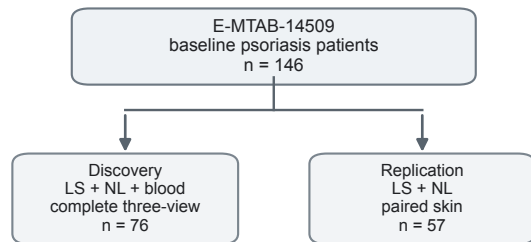

Figure 1. Study design and transition from discrete endotypes to continuous molecular programs

a Cohort and analysis architecture

82 paired-skin patients available;
76 had complete LS/NL/blood data

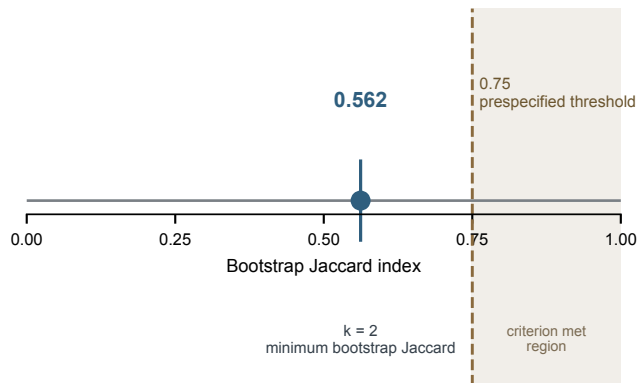

skin-only replication;
no blood replication set

b Analysis-set availability

	Lesional skin	Non-lesional skin	Blood
Discovery	82 paired skin	82 paired skin	76 complete-case
Replication	57 paired skin	57 paired skin	- unavailable

Discovery blood is shown as the complete-case multi-view set, not as 82 independent blood-replication samples.

c Prespecified discrete-cluster stability test

d Representation decision
